WA'TER, wā'tär, s. [waeter, Dutch; poēter, Saxon.]

—1. Sir Isaac Newton defines water, when pure, to be a very fluid salt, volatile, and void of all savour or taste. It seems to consist of small, smooth, hard, porous, spherical particles, of equal diameters, and of equal specifick gravities, as Dr. Chyne observes. Their smoothness accounts for their sliding easily over one another's surfaces; their sphericity keeps them also from touching one another in more points than one; and by both these their frictions insinuating over one another is rendered the least possible. Their hardness accounts for the incompressibility of water, when it is free from the intermixture of air. The porosity of water is so very great, that there is at least forty times as much space as matter in it. *Quincy. Shaks.*—2. The sea. *Com. Prayer.*—3. Urine. *Shaks.*—4. To hold WATER.
